## 1. Introduction: Understanding ALS – A Compassionate Overview

What is Amyotrophic Lateral Sclerosis (ALS)?

ALS, also known as Lou Gehrig's disease, is a progressive neurodegenerative disease that affects nerve cells in the brain and spinal cord. This leads to the loss of muscle control, causing weakness, muscle atrophy, and eventually paralysis. While the mind remains unaffected, the body's ability to function diminishes over time. There is currently no cure for ALS, but treatments exist to manage symptoms and improve quality of life.

Types of ALS:

ALS isn't monolithic. It can manifest in different ways, including:

Sporadic ALS: The most common form, affecting individuals with no family history of the disease.

Familial ALS: A hereditary form, where the disease is passed down through families.

Frontotemporal Dementia (FTD) with ALS: A combined neurodegenerative disorder impacting both cognitive function and motor skills.

Understanding the specific type of ALS plays a crucial role in prognosis and treatment planning.

Early symptoms can be subtle and easily overlooked, often including:

Muscle weakness or twitching (fasciculations)
